The following list includes all recognized species of amphibians known by vouchers or published information to occur within the political borders of Brazil as of August, 2016. The taxonomy follows Frost (2016), including the changes proposed recently by Duellman et al. (2016). The known amphibian fauna of Brazil comprises 1,080 species. The vast majority of species are anurans, including 1,039 species representing 20 families and 90 genera, followed by caecilians, with 36 species in four families and 12 genera, and salamanders, with five species in a single family and genus.
